Tend helps sexual assault survivors claim crime victim compensation. Every state and DC has money set aside to pay back costs like medical bills, counseling, and lost pay. A survivor answers four questions. Then Tend reads their bank statement and bills on their own device, checks each cost against their state's law, and builds the claim. Every dollar in it comes with the exact sentence of law behind it. Tend never asks for a name or what happened. It covers all 50 states and DC, though only Michigan's application form is filled in so far. Tend is a prototype. It is not legal advice, and the program decides every claim.

Key facts

In 2022, 96 percent of violent crime victims got no victim compensation.

Source: Alliance for Safety and Justice (now Just Safe), Beyond the Headlines: A Decade of Listening to Crime Survivors, October 1, 2025

Every state and DC runs a crime victim compensation program under its own law. Tend has rules for all 51.

Source: Tend's rules data

Tend's law library holds 2,728 rules from 824 saved sources. A rule gets in only if its quote appears word for word in the saved copy of its source.

Sources: The rules as JSON and CSV; verify.py, the check

Each state's law runs in the browser, in a C++ engine compiled to 183 KB of WebAssembly. Only a yes sends the law check to Tend's server, or bills and bank rows to cloud AI. The state picked still reaches Tend's server and its host's logs, with the IP address.

Sources: tend.wasm, the engine itself; Design for safety; docs/PRIVACY.md

On 121,000 test claims, the C++ engine and a separate Python engine showed 0 differences. That shows both read Tend's spec the same way. It does not show the spec reads the law correctly.

Source: docs/EVAL.md

Tend has no accounts and never asks for a name or what happened. Every page has an Exit this page button that swaps Tend for a Google search for the weather.

Sources: Design for safety; docs/PRIVACY.md

A share link for an advocate is locked in the browser with AES-256-GCM. The key sits after the # in the link, a part browsers never send to a server.

Source: docs/PRIVACY.md

In the demo, a fictional survivor's $443.00 hospital bill includes a $325.00 forensic exam. Tend holds that line and drafts a letter to the billing office. Michigan law says a health care provider "shall not submit a bill for any portion" of the exam's costs to the victim.

What's real and what's demo

Real	The law: statutes, regulations, and program pages for all 51 jurisdictions, each saved with its SHA-256, and Michigan's real application form. A word-for-word quote shows the words are in the source. It does not show Tend read them correctly.
Fictional	Rowan Hale, Riverbend General Hospital, every merchant, and every dollar in the demo.
Mock	The bank. Nessie is Capital One's mock bank API, so a payment confirmed in the demo moves only mock money.
Prototype	No real users and no partners. Tend files nothing: the survivor sends the packet. Only Michigan's application is filled in. Other states get the program's blank form, or a note that Tend found none.
AI	Gemini Nano, on the device when Chrome has it, reads photos and scans of bills, and suggests labels for costs the rules miss. The engine decides what counts and how much. Cloud Gemini can do the same, but only after a yes on a screen that names what would be sent and what Google may do with it.
